What will we cover today?

Section 2: Urban Forms					
2.1	I understand the physical and human factors determining urban forms.	☐	☐	☐	Choose an item.
2.2	I understand the spatial patterns of land use and the factors that influence them by being able to describe and explain the differences between different urban land use models from contrasting areas of the world	☐	☐	☐	Choose an item.
2.3	I can describe and explain the formation of new urban land uses: town centre mixed developments, cultural and heritage quarters, fortress landscapes, gentrified inner areas and edge cities.	☐	☐	☐	Choose an item.

True or False?

Q1	***True or False?***	
A	The CBD has the highest land prices due to competition between commercial businesses.	True
B	Physical features of an area have no impact on urban form.	False
C	The rural-urban fringe of developed world cities have larger residential properties.	True
D	Recreational land use in a city is restricted due to pressure for an increase in housing.	True
E	Cities in both the developed and the developing world have a similar form.	False

Spot the mistake!

One sentence is incorrect in each of the explanations below. Identify the wrong one.

A	New arrivals to a developed world city like to live in areas where their cultures are already established. These areas are often in the wealthier areas of a city, for example, on the rural-urban fringe. There is a ready-made sense of community and practical assistance.
B	Rural-urban migration in the developing world leads to a growth of squatter settlements in the cities. These settlements are illegal housing and are often without sanitation and adequate sewerage facilities. They only locate in one area of the city as their growth is restricted.
C	More frequently, the changes in land use in a city can affect the urban form. An increase in brownfield sites in developed world cities has led to an increase in recreational areas for families to use. Many developers prefer to build on greenfield, rather than brownfield land.
D	Industrial land use in a developed world city is located in the CBD. This is to allow for easy trade and for the workers to be able to travel to work. The CBD is the most accessible part of the city.
E	Commuter villages have developed on the edge of developed world urban areas. This occurs due to a lack of housing in the city itself. People can live on the outskirts and still work in the city.

One sentence is incorrect in each of the explanations below. Identify the wrong one.

A	New arrivals to a developed world city like to live in areas where their cultures are already established. ~~These areas are often in the wealthier areas of a city, for example, on the rural-urban fringe.~~ There is a ready-made sense of community and practical assistance.
B	Rural-urban migration in the developing world leads to a growth of squatter settlements in the cities. These settlements are illegal housing and are often without sanitation and adequate sewerage facilities. ~~They only locate in one area of the city as their growth is restricted.~~
C	More frequently, the changes in land use in a city can affect the urban form. ~~An increase in brownfield sites in developed world cities has led to an increase in recreational areas for families to use~~. Many developers prefer to build on greenfield, rather than brownfield land.
D	~~Industrial land use in a developed world city is located in the CBD~~. This is to allow for easy trade and for the workers to be able to travel to work. The CBD is the most accessible part of the city.
E	Commuter villages have developed on the edge of developed world urban areas. ~~This occurs due to a lack of housing in the city itself.~~ People can live on the outskirts and still work in the city.

What is urban form?

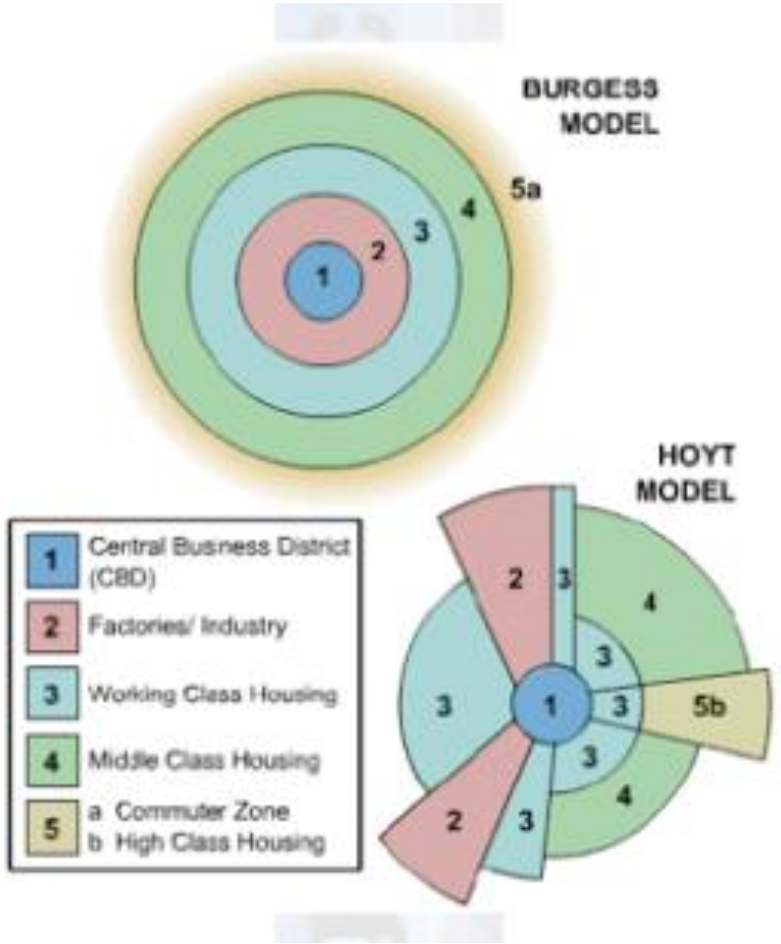

Urban Form: the physical characteristics of built-up areas including the shape, size, density and makeup or configuration of settlements.

Urban form changes with:

- **Population (e.g migration)**
- **Environment (e.g sewage systems)**
- **Economy (e.g industry)**
- **Technology (e.g hard wires)**
- **Policies (e.g government policies)**

Megacities are a complex system made up of these smaller systems. They are unstable as they are constantly undergoing change.

How do cities grow?

- The major differences between the Burgess and the Hoyt models is the fact that the Burgess model is based around a simple circle-based area organizational, where the center circle is the CBD, then around the CBD are ‘rings’ of other zones.
- The Hoyt Model, on the other hand, is based on a more complex area organizational system. The only similarity is that the CBD is located in the middle. Other than that the other areas are in a seemingly randomly positioned organizational system.
- The idea behind the Hoyt Model is that it provides every area except the CBD to develop more outward in case more area is needed.

Match the land use to the zone

CBD	Slums or shanty towns have traditionally developed on the edge of the city next to transport routes or in unpopular areas such as next to rubbish dumps. Steep slopes, unstable slopes and areas prone to natural hazards are also typical sites.
Inner city	These tend to be on the edge of urban areas where there is good access to main roads. They are also often located near to universities.
Residential	The central area where shops, offices and entertainment facilities are found
Green areas	Housing from range of periods which traditionally gets larger and more expensive towards the outskirts of the city, however outer city council estates are now some of the most deprived areas of British cities
Out-of-town developments	Manufacturing industries require large areas of land and so ted to locate towards the edge of cities where cheaper land is available. Deindustrialisation has meant that former factory sites may have been demolished and the land converted to other uses
Business or Science parks	Originally developed by large supermarkets these soon expanded to include retail and entertainment complexes. They had a negative impact on the traditional shopping area in the CBD as people were attracted by free parking and the under-cover shopping centres.
Industry	Parks tend to be dotted throughout urban areas, ranging from botanical gardens of national importance down to playgrounds within housing estates
Informal settlements	An area of old terraced housing and light manufacturing industry dating back to the Industrial Revolution. Many British cities have witnessed regeneration in these areas in the last 3 decades

Simplified Distance Decay Model

Why are cities laid out the way they are?

New urban land uses

What will we cover today?

Section 2: Urban Forms					
2.1	I understand the physical and human factors determining urban forms.	☐	☐	☐	Choose an item.
2.2	I understand the spatial patterns of land use and the factors that influence them by being able to describe and explain the differences between different urban land use models from contrasting areas of the world	☐	☐	☐	Choose an item.
2.3	I can describe and explain the formation of new urban land uses: town centre mixed developments, cultural and heritage quarters, fortress landscapes, gentrified inner areas and edge cities.	☐	☐	☐	Choose an item.

Town centre mixed development

Many cities have encouraged the development of functions other than retailing to increase the attractions of the city centre. These include:

1. A wider range of leisure facilities including cinemas, cafes, wine bars and restaurants.
2. More open spaces including plazas or squares, to enable people to watch street entertainment eg in Covent Garden in London.
3. Developing nightlife such as clubbing
4. Flagship attractions such as Millennium Point or Sea Life Centre in London
5. Constructing new offices, apartments, hotels and conference centres to raise the status of the CBD for business and encourage more tourism
6. Encourage residents to return to the city by providing flat, redeveloping old buildings or building new upmarket apartments

MARKET COFFEE HOUSE
intu
Broadmarsh

Evaluating this strategy

- The combination of these strategies, together with stricter planning control places on out-of-town developments has meant that large UK cities have successfully attracted shoppers and visitors back.

- Boost to local economies and economic multiplier effect through increased diversity of city centre employment in the Tertiary industry

- Decision makers are still worried about the decline of smaller CBDs

Cultural and heritage quarters

- **Culturally-led urban redevelopment began to appear in the 1980s**, with early examples including Birmingham Jewellery Quarter.
- **A cultural quarter need to have the presence of cultural production** (making objects, goods or products) **or cultural consumption** (people going to shows, visiting venues and galleries)
- **Heritage quarters focus more on the history of the area.** The most successful tend to be associated with a particular product, such as the Jewellery Quarter in Birmingham

Evaluation:

Some quarters have been more successful than others, but as a tool for regeneration and improving perceptions of a place, as well as preserving history and culture, quarters tend to be viewed in a positive light.

Fortress Landscapes

This term refers to landscapes designed around security, protection, surveillance and exclusion.

What methods can you spot in the following pictures?

YORK MINSTER
DEANS PARK

Spot the difference

Fortress Landscapes

Ways this has been done include:

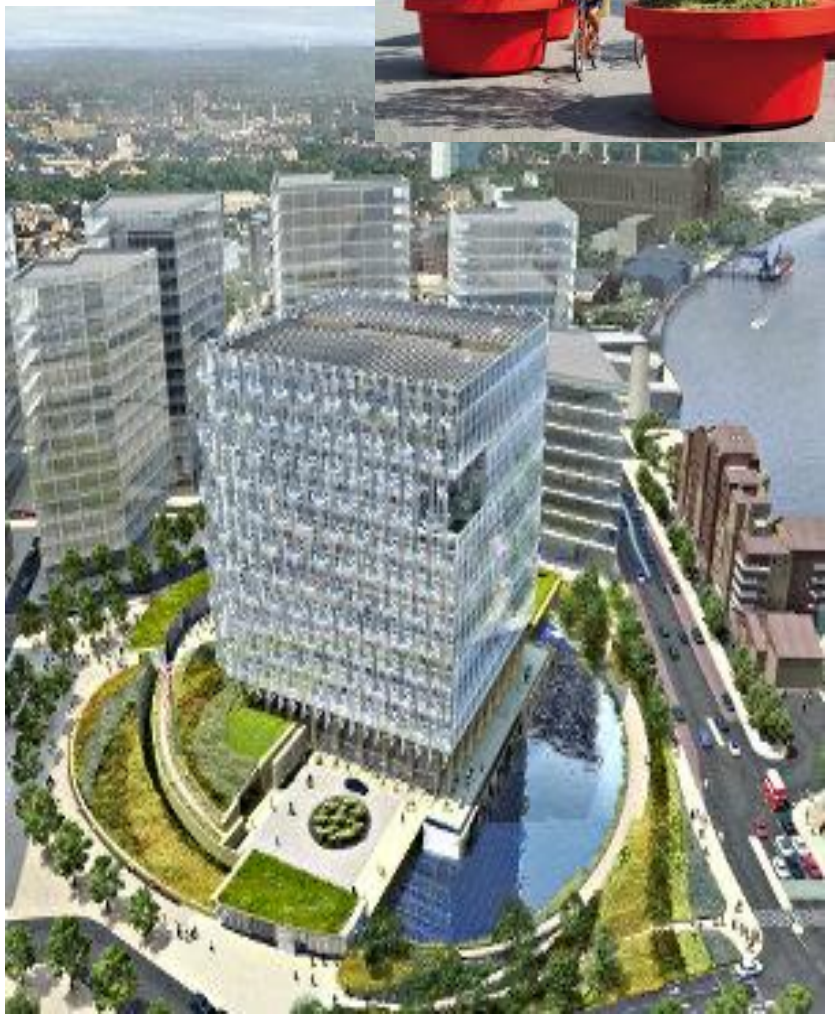

- *Greater use of CCTV*
- *Railing around private spaces (defensible space)*
- *Effective use of street lighting*
- *Speed bumps to prevent joy-riding*
- *Designing out crime – better natural surveillance, front gardens with fences or hedges*
- *Gated communities – the use of guards or electronic control of access to housing complexes*
- *Anti-homeless spikes fitted into the ground in shop doorways*
- *High-pitched noises that are annoying or harming to under 25's to hear*

Examples

Example: Regeneration and Fortress Landscaping in Manchester – Wythenshawe estate

- More windows for better natural surveillance
- Front gardens with hedges or fences
- Bins in gated compounds
- No recessed doorways
- No projecting window sills
- No exposed drain pipes
- No dark alleys or dead ends associated with drug dealing

Evaluating Fortress Landscapes

Fortress Landscaping improves safety and security for residents *e.g Greater use of CCTV – deterrent to commit crime*

But how might some fortress landscaping methods make you ***feel*** *as a young person? How can we link this to changing places?*

Gentrified Inner Areas

The buying and renovating of properties often in more run-down areas by wealthier individuals.

Causes:

- The rent gap
- Commuting costs
- ‘Pioneer’/Trendy image

Costs	Benefits
People on low incomes cannot afford higher property prices or rents	Rise in general level of prosperity and increasing number and range of services and businesses
Higher car ownership may increase congestion	Increased local tax income for the local authority
Potential loss of business for traditional local low order shops	Physical environment of the area improved
'Gentrifiers' may be seen as a threat to the traditional community and friction may occur between 'newcomers' and original residents	Greater employment opportunities created in areas such as design, building and refurbishment

Edge Cities

A self-contained settlement which has emerged beyond the original city boundary and developed as a city in its own right.

- Common in N.America – e.g LA
- Lack a clear structure but have good services.
- Associated with extreme social segregation – wealthy moved to new suburban settlements

Examples

What will we cover today?

2.4	I understand the concept of the post-modern western city I can analyse to the extent to which London can be considered a PMW city.	☐	☐	☐	Choose an item.

The post-modern western city

- **In the twentieth century, urban areas were characterised by high-rise blocks made out of concrete and glass.**
- **Fortress cities and edge cities are often classed as Post-Modern**

Features include:

- Architecture: -Non-Uniformity towards structures being more varied in design. E.g Shapes and styles, references to the past. Examples of post-modernist buildings include the Shard, the Gherkin and City Hall in London.
- Economy: T and Q industry not S, Globalised and Capitalist
- Culture and Race: Greater ethnic diversity but more social and economic inequalities
- Structure: High tech areas and chaotic multimodal structure (urban form)
- Planning: Incorporate the views of many stakeholders
- Government: Private and Public sector working together,

Example question:

London has been described as being ‘depthlessness’ and ‘fragmented’. Using the sources provided, assess to what extent London can be considered a Post-Modern Western city (9 marks)

We will work through this together!

Architecture: Evidence FOR Post-Modern Western City – these buildings have new shapes and styles, not confirmative. ‘Style over Subance’

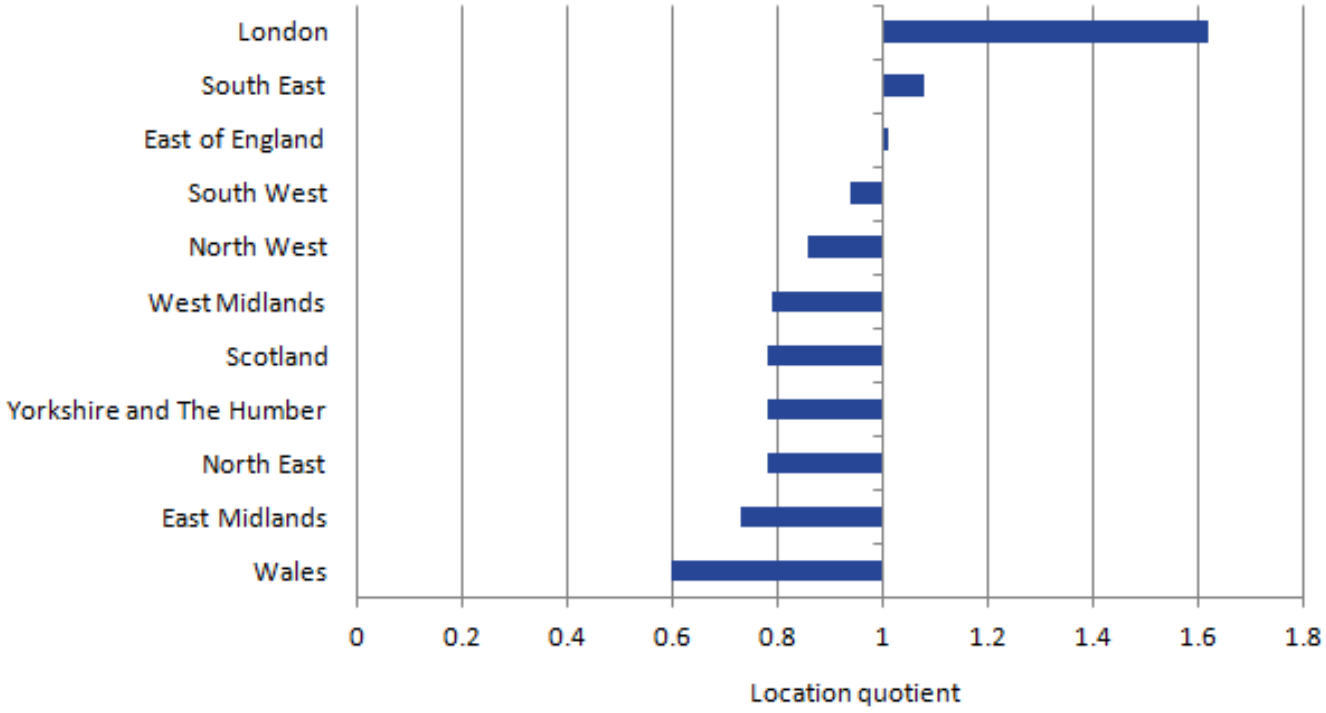

Architecture: Evidence AGAINST Post-Modern Western City – these buildings are very old and have a historical style ’

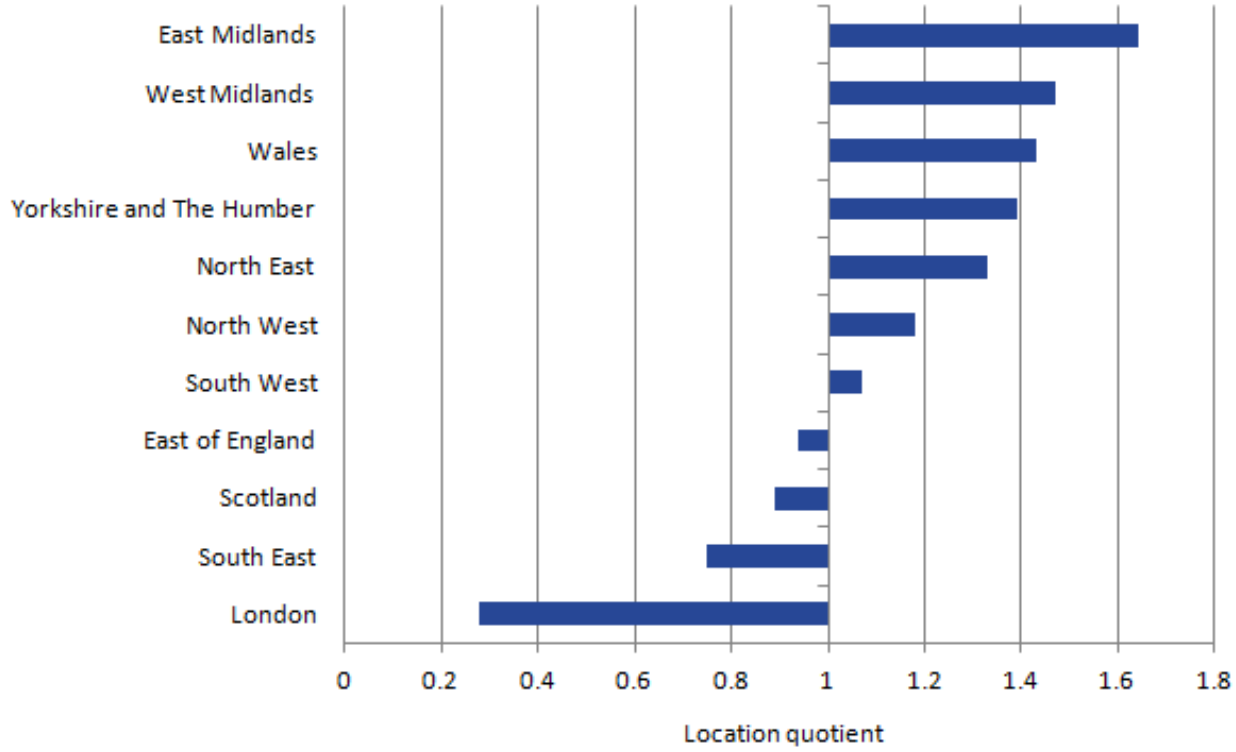

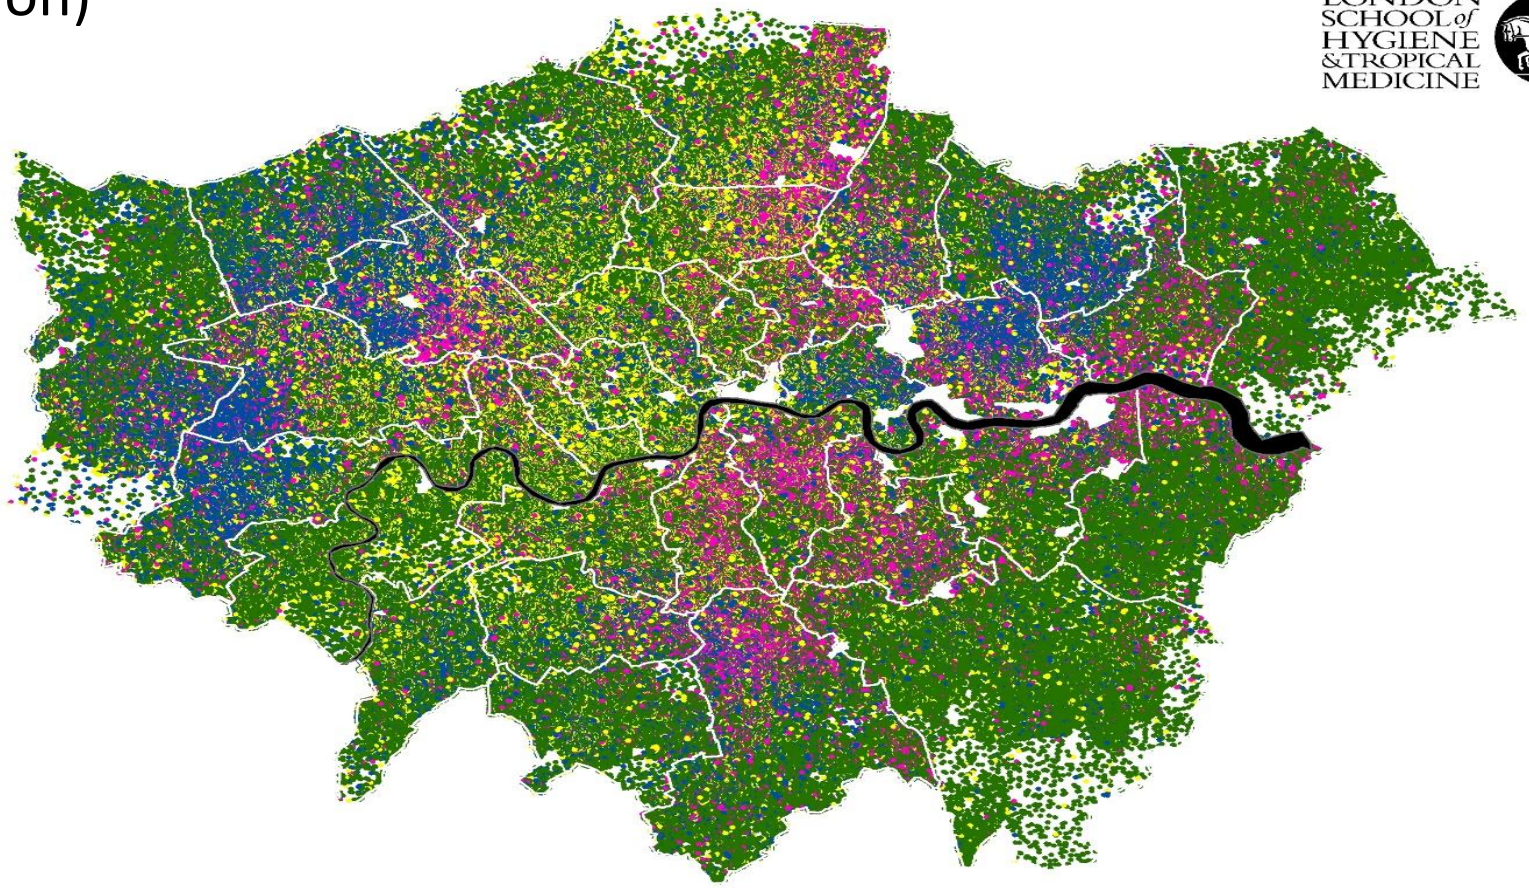

Economy: Evidence FOR Post-Modern Western City – this graph shows that more people in London work in the T and Q sector. (by a factor of 0.6)

Economy: Evidence FOR Post-Modern Western City – this graph shows that less people in London work in the S sector (manufacturing). (by a factor of 0.3)

Culture and Race: Evidence FOR Post-Modern Western City – this map shows a great diversity of different ethnicities. Whilst there is some ‘pockets’ of different ethnicities e.g in the West with Asian or Asian British and the East for Black and Black British, there is mostly a spread of different races and cultures living together, especially in the centre of London)

What evidence don't you have?

Architecture: -Non-Uniformity towards structures being more varied in design. E.g Shapes and styles, references to the past. Examples of post-modernist buildings include the Shard, the Gherkin and City Hall in London.

Economy: T and Q industry not S, **Globalised and Capitalist**

Culture and Race: Greater ethnic diversity but more **social and economic inequalities**

Structure: **High tech areas and chaotic multimodal structure (urban form)**

Planning: **Incorporate the views of many stakeholders**

Government: **Private and Public sector working together,**

One Opinion

‘Overall claiming London as post modern is daring and questionable. It certainly has post modern elements such as its varied and developed culture, the innovative architecture and even the economy which has seen increased specialisation of workers who are now multi skilled rather than one dimensional. Yet London is a landscaped that features so much more than this, Victorian buildings, modern art, and traditional music are still prominent in the city. London features the post modern but could never be claimed as completely post modern.’
